PROJECTS

FishDex | *React Native, TypeScript, ASP.NET Core, C#, PostgreSQL, AWS, OpenAI* May 2026 – Sep 2026

- Built a full-stack mobile fishing app from scratch featuring AI-powered fish identification using GPT-4 Vision, allowing users to photograph a catch and identify the species from a curated database of 100 US fish species
- Designed and implemented a RESTful ASP.NET Core backend with JWT authentication, BCrypt password hashing, and token invalidation on logout, deployed on AWS EC2 with HTTPS via Let's Encrypt SSL
- Engineered a PostgreSQL database with 7 relational tables including a many-to-many junction table for fish species and US regions, and a Pokédex-style species tracker with automatic unlock on identification
- Rendered interactive US Fish & Wildlife Service region boundaries using official GeoJSON data with a point-in-polygon algorithm to detect and highlight the user's current region in real time
- Implemented full CRUD fish logging with photo storage, optional weight/length fields, form validation, and pre-filled forms from the AI identification flow
